

Importing Images

It is important to remember that printed images require a higher resolution than images that are displayed on the screen. With that in mind, images imported into QL2 should be somewhat larger dimensionally than the size they are expected to be in your report document in order to prevent blurry images in the printed report. In other words, if you expect the image to be two inches square in your report, you would need to import the image at three to four inches square, depending on your printer's resolution.

A little experimentation with your printer should have your images printing nicely. The setting to "Enable large image storage" is available in Options should you receive a warning when sizing your images.

Auto Formatting

The image auto formatting feature can be enabled in Options to automatically size and compress imported images.

Automatically format images

Image width
4.5 inches

Image compression
70 %

If auto formatting is enabled in Options, it can be temporarily suspended from within the image import dialog in the worksheet. This accommodates the import of special case images such as watches or necklaces that don't fit the standard image dimensions.

When checked, auto formatting will be suspended only while the dialog is open. Once the dialog is closed, auto formatting reverts to the previous state.

There are several methods for importing images...

- The "Browse" button in the image dialog can be used to select the desired image file(s).
- Image files can be dragged and dropped into the image dialog.
- Image files can be dragged and dropped onto the image preview area.
